
MIDAS (MDS) — Governance Token Whitepaper (v1.0)

1. Introduction

MIDAS (MDS) is the **governance backbone** of the Troyvest ecosystem.

Where **TROY** drives utility, **MDS** drives **governance, treasury control, policy approvals, and long-term protocol direction**.

MDS ensures *community ownership* by giving real decision-making power to stakers, voters, and long-term contributors.

2. Purpose of MIDAS

MDS is designed to:

- Govern the treasury
- Approve upgrades, insurance parameters, yield policies
- Control risk models for TroyShield
- Decide staking reward caps
- Approve cross-chain deployments
- Manage ecosystem grants
- Control future Troy Chain validator policies

The philosophy is simple:

“Decisions belong to the community, not a single private key.”

3. Governance Power

MDS holders can vote on:

A. Treasury Unlocks

- Monthly unlock caps
- Spending allocations
- Emergency pauses
- Funding for DEX liquidity or partnerships

B. Insurance Governance (TroyShield)

- Premium adjustments
- Risk pool parameters
- Claim assessor incentives
- Payout quota approvals

C. Protocol Parameters

- Oracle sources
- Vault yield routes
- DEX fee models
- Staking APYs
- Locking periods

D. Upgrades & Long-Term Direction

- New chain deployments
 - Cross-chain bridges
 - Ecosystem expansion grants
 - Troy Chain validator distribution
-

4. Governance Architecture

MDS uses a hybrid governance layer:

- **On-chain voting** (Governor + Timelock)
- **Off-chain Snapshot voting** for low-gas decisions
- **DAO treasury wallet** protected by time-delay
- **Proposal submission tiers** (lite, standard, critical)

All governance events are recorded on-chain for public accountability.

5. Utility of MDS

MDS is not just a voting token. It also provides:

- **Access to governance-only vaults**
- **Higher weight in ecosystem rewards**
- **Discounted protocol fees**
- **Eligibility for cross-chain validator spots (future Troy Chain)**
- **Priority in ecosystem airdrops**

- Revenue-share from governance-approved sources
-

6. MDS Airdrop Mechanism

MDS is initially distributed to:

- Active TROY stakers
- Early governance contributors
- Long-term liquidity providers

The airdrop rewards loyalty and reduces early speculation risk.

7. Security & Compliance

All MDS governance actions follow:

- Timelock execution
- Multi-sig fail-safes
- DAO audit transparency
- Public voting records
